Galactic Faraday depth

Results:

- $\sigma_{\rm e} \lesssim 7 \, {\rm rad}/{\rm m}^2$
- constraints on extragalactic contributions for individual sources very weak

What magnetic fields is this due to?

Results:

- ► $\sigma_{\rm e} \lesssim 7 \, {\rm rad/m^2}$
- constraints on extragalactic contributions for individual sources very weak

V. Vacca, NO, et al.; arXiv:1509.00747

V. Vacca, NO, et al.; arXiv:1509.00747

Summary

- Galactic contribution (correlated) can be separated from rest (uncorrelated)
- Rest can be separated statistically into extragalactic and noise
- Extragalactic contributions contain information on B-fields on cosmic scales
- Uncertainties are large and need to be understood
